

Angular (v20+) Hands-On Lab Report

Incremental Project: Student Course Portal

Hands-On:	Hands-On 5 [Advanced]
Topic:	Reactive Forms, Custom Sync/Async Validators & FormArrays
Developer:	Cathy George
OS Version:	Windows 11
Date:	July 22, 2026
Track:	Java FSE Angular Track

1. Objective

The primary objective of this exercise is to implement and configure a fully Reactive Form inside the Student Profile component of the portal using Angular's `ReactiveFormsModule`. We replace template-driven directives with an explicitly constructed component-side `FormGroup` tree managed via `FormBuilder`. Key goals include implementing a custom synchronous domain-restricting validator, writing an asynchronous uniqueness check validator with RxJS simulated timer delays, managing a list of academic project sub-form controls dynamically using `FormArray`, and binding error validation status reactively in the template to create a premium, responsive UX.

2. Angular Concepts Covered

- **Reactive Forms (`ReactiveFormsModule`):** Modeling forms explicitly inside the TypeScript class code. Offers robust unit-testability, programmatic form changes, and synchronous/asynchronous validator bindings.
- **`FormBuilder` & `FormGroup`:** Syntactic sugar mapping form fields into a unified tree hierarchy control model containing `FormGroups` and `FormArrays`.
- **`FormArray`:** A dynamic collection of `FormControls` or `FormGroups`. Used here to permit students to dynamically append and remove academic projects in real-time.
- **Custom Sync Validator:** Component-side rule functions returning `ValidationErrors`. Implemented as `universityEmailValidator()` which restricts emails to the `@university.edu` domain.
- **Async Validator:** Asynchronous checking functions returning `Observables` or `Promises`. Implemented as `emailUniqueValidator()` using an RxJS `timer(800)` debounce delay to mock network queries checking if an email is taken.
- **Dynamic Control Manipulations:** Exposing methods like `addProject()` and `removeProject(i)` that alter the `FormArray` control count at runtime.
- **Reactive Validation Feedback:** Displaying error messages and disabling submit buttons by directly querying `profileForm.get('field')?.errors` status changes in the template.

3. Software & Tools Used

Software / Tool	Version / URL
Node.js + npm	v22.20.0 (LTS 20+) / npm 10.9.3
Angular CLI	v21.2.16
Vitest Runner	v4.1.10
PDF Generator	Python 3.14 + ReportLab library

4. Project Folder Structure

```
student-course-portal/  
  ■■■ src/  
  ■■■ app/  
  ■■■ validators/  
  ■ ■■■ profile.validators.ts (Custom domain sync & async email taken validators)  
  ■■■ pages/  
  ■■■ student-profile/  
  ■■■ student-profile.ts (FormBuilder Reactive configuration, FormArray logic, onReset)  
  ■■■ student-profile.html (Reactive formGroup and formArrayName templates bindings)  
  ■■■ student-profile.css (FormArray projects card grids and pending loading dot styles)  
  ■■■ student-profile.spec.ts (Vitest specs testing async validators, resets and array sizes)
```

5. Key Code Implementation Details

Custom Synchronous & Asynchronous Validators (src/app/validators/profile.validators.ts)

```
export function universityEmailValidator(): ValidatorFn {
  return (control: AbstractControl): ValidationErrors | null => {
    const val = control.value;
    if (!val) return null;
    return val.toLowerCase().endsWith('@university.edu') ? null : { invalidDomain: true };
  };
}

export function emailUniqueValidator(): AsyncValidatorFn {
  return (control: AbstractControl): Observable<ValidationErrors | null> => {
    const val = control.value;
    if (!val) return timer(0).pipe(map(() => null));
    return timer(800).pipe(
      map(() => {
        const takenEmails = ['taken@university.edu', 'admin@university.edu', 'already.registered@university.edu'];
        return takenEmails.includes(val.toLowerCase()) ? { emailTaken: true } : null;
      })
    );
  };
}
```

Student Profile Component Initialization & FormArray Logic (src/app/pages/student-profile/student-profile.ts)

```
this.profileForm = this.fb.group({
  name: [this.student.name, [Validators.required, Validators.minLength(3), Validators.pattern('^[a-zA-Z\\s]*$')]],
  email: [this.student.email, [Validators.required, Validators.email, universityEmailValidator(),
    emailUniqueValidator()]],
  department: [this.student.department, [Validators.required, Validators.minLength(4)]],
  gpa: [this.student.gpa, [Validators.required, Validators.min(0), Validators.max(4)]],
  enrolledCredits: [this.student.enrolledCredits, [Validators.required, Validators.min(1), Validators.max(30),
    Validators.pattern('^[0-9]+$')]],
  avatar: [this.student.avatar, [Validators.required]],
  bio: [this.student.bio, [Validators.required, Validators.minLength(10), Validators.maxLength(200)]],
  projects: this.fb.array([])
});

get projects(): FormArray {
  return this.profileForm.get('projects') as FormArray;
}

addProject(title: string = '', tech: string = ''): void {
  this.projects.push(this.fb.group({
    title: [title, [Validators.required, Validators.minLength(3)]],
    tech: [tech, [Validators.required]]
  }));
}

removeProject(index: number): void {
  this.projects.removeAt(index);
}
```

Template Markup for FormArray Loops & Pending Status (src/app/pages/student-profile/student-profile.html)

```
<div *ngIf="profileForm.get('email')?.pending" class="pending-msg">
<span class="pulse-dot"></span> Checking email uniqueness...
</div>
<div *ngIf="profileForm.get('email')?.invalid && (profileForm.get('email')?.touched ||
profileForm.get('email')?.dirty)" class="error-msg">
<span *ngIf="profileForm.get('email')?.errors?.['invalidDomain']">Email must end with @university.edu.</span>
<span *ngIf="profileForm.get('email')?.errors?.['emailTaken']">This email is already taken.</span>
</div>

<div formArrayName="projects" class="projects-list">
<div *ngFor="let proj of projects.controls; let i=index" [formGroupName]="i" class="project-item">
<input type="text" formControlName="title" placeholder="Project Title" class="form-input" />
<input type="text" formControlName="tech" placeholder="Technologies" class="form-input" />
<button type="button" class="btn-remove-project" (click)="removeProject(i)">x</button>
</div>
</div>
```

6. Captured Screenshots & Verification

All application features were fully verified in the browser:

Screenshot: Initial loaded Student Profile with Reactive form states, FormBuilder initial mapping, and projects list from FormArray

The screenshot shows a web application interface for a 'Student Course Portal'. The top navigation bar includes links for 'Home', 'Courses', and 'Profile'. The main content area is titled 'Student Profile' with a subtitle 'Manage your personal information, academic statistics and active profile details.' Below this, there is a profile card for 'Cathy George' with her department 'Computer Science & Engineering' and email 'cathy.george@university.edu'. To the right, the 'Edit Academic Profile' section contains several input fields: 'Full Name' (Cathy George), 'Department / Major' (Computer Science & Engineering), 'Email Address' (cathy.george@university.edu), 'GPA (0.00 - 4.00)' (3.85), 'Enrolled Credits (1 - 30)' (6), and 'Short Biography' (Passionate software engineer in training. Interested in Angular, cloud infrastructure, and databases.). The profile card also displays 'CUMULATIVE GPA' as 3.85 and 'ENROLLED CREDITS' as 6 CR. A message at the top of the profile card indicates a pending state: 'Checking email uniqueness...'.

Screenshot: Form showing validation errors: name pattern mismatch, department too short, sync domain validation failure, and async validator marking email taken error

7. Output & Behavioral Explanations

- **Reactive Form Model:** We instantiated a TypeScript object using `fb.group()`. Unlike templates, this gives the component programmatic command over validity tracking and field manipulations.
- **Custom Domain Synchronous Validator:** The `universityEmailValidator()` restricts email field inputs to domains ending in `@university.edu`. If invalid, the `FormControl` receives the `{ invalidDomain: true }` error.
- **Asynchronous Uniqueness Validator:** The `emailUniqueValidator()` returns an `Observable` timer. While checking database status, the email control transitions to a `PENDING` status, triggering a spinner overlay. If the input matches a registered email, it returns `{ emailTaken: true }`.
- **FormArray Dynamic Controls:** The `projects` sub-structure array represents a collection of `FormGroups`. Users can append items using `projects.push()` or remove items via index `projects.removeAt(i)` dynamically inside the view.
- **Rollback capability (onReset):** Calling `profileForm.reset()` and recreating `FormArray` controls reverts inputs to committed models while cleaning validation flags.

8. Learning Outcomes & Conclusion

- ✓ Constructed advanced Reactive Forms in Angular using `ReactiveFormsModule`, `FormBuilder`, and `FormGroup` models.
- ✓ Built dynamic controls inside views by utilizing `FormArray` arrays containing multiple sub-groups.
- ✓ Implemented custom validation rules checking synchronous domains and asynchronous unique criteria with debounce timers.
- ✓ Created loading visual states indicating when async validators are query-pending.
- ✓ Asserted validation states, `FormArray` insertions/deletions, and async status updates through Vitest testing.

9. Conclusion

Hands-On 5 successfully transitions the Student Profile page form implementation from a basic Template-driven architecture into a programmatically managed Reactive Form. Utilizing advanced custom and asynchronous validators, dynamic `FormArray` listings, and real-time validation checks, the form provides clean data entry logic, comprehensive unit-testing interfaces, and a premium responsive user experience.
